

# **Reagent Code Lists for Aiding Beginning Students in Determining the Structure of an Organic Chemistry Reaction Product.**

**John H. MacMillan Ph.D.**

**Department of Chemistry, Temple University,**

**Philadelphia, Pa. 19122**

## **Abstract:**

Use of reagent code lists allows beginning organic chemistry students to identify the net reactive species, i.e. the "code" for an organic reaction when a set of reagents, solvents and or catalysts are given. For example, the reagent pair dichromate/acid "codes" for oxygen, although not actually present, as the net reactive species. This code allows easier prediction of oxidation reactions with alcohols, alkenes and other groups. The reagent group mercury trifluoro acetate/water/sodium borohydride "codes" for addition of water to an alkene. When presented in tabular format, with reactant, reagent code, active species and product given, the students more easily follow the lecture. The instructor may present the reactions on the board or with slides, then refer the students to the appropriate "reaction codes" on the list. This process allows greater organization of the lecture for both instructor and student, and gives the student an understanding of what is actually occurring in an organic reaction when a series of reagents, solvents and or catalysts is presented for a reaction. Predicting the product becomes much easier and students indicate that they learn the reactions at a faster rate.

## Discussion

Many beginning organic chemistry students initially have great difficulty with reactions, where, above or below the arrows, a series of reactants, solvents and /or catalysts are written. Without any previous exposure to many of these, they often do not understand how the set of reagents translates to, or "codes" to a reactive species such as oxygen, hydride ion, a carbanion etc. Once they understand the "code" for the reagent set with a reactant, they more easily predict reaction products. While teaching organic chemistry lecture over the last several years, I have generated "code lists" to help students recognize the actual and or net reactive species for the code. For example, sodium borohydride and lithium aluminum hydride "code" to a hydride ion,  $\text{H}^-$ , which, although not actually present, aids in predicting reactions with carbonyl compounds. A Grignard reagent codes to a "net" carbanion as reactive species. Even though this species does not actually form in the mechanistic sequence, thinking of a Grignard as an " $\text{R}^-$ " allows easier prediction of reaction products with carbonyls or acids. Likewise, sodium nitrite/acid codes to nitrous acid, which with primary aromatic amines in turn codes to a "net", if fictitious, phenyl carbocation. For the students, thinking of sodium nitrate/acid "coding" to phenyl carbocations,  $\text{C}_6\text{H}_5^+$ , with aromatic amines as starting material, allows easy predictions of products with halide, water, cyanide or other nucleophiles. Student feedback over five years indicates quicker assimilation of these reactions for exams, and allow for easier organization of the assigned material. The tables also list any limitations and stereochemistry for the reactions if appropriate.

**Tables 1-XIV give code lists for the most common sophomore organic chemistry reactions, in roughly the order presented in the introductory organic texts. Lists are presented through carbohydrate chemistry. Instructors may modify these tables or change the sequence if they desire. The texts in the references,<sup>1,2</sup> were employed in generating these lists.**

**The author welcomes any comments or feedback on the utility of this organic chemistry teaching aid.**

Table XI

Reagent code list for carbonyl

alpha-substitution reactions

<u>CARBONYL ALPHA</u>	<u>SUBSTITUTION</u>	<u>REACTIONS</u>	<u>CODE</u>	<u>LIST</u>
<u>STARTING MATERIAL</u>	<u>REAGENT CODE</u>	<u>NU<sup>-</sup></u>	<u>PRODUCT</u>	<u>STRUCTURE</u>
Aldehyde or ketone with alpha hydrogens $\text{RCH}_2\text{C}=\text{O}(\text{H})(\text{R})$	$\text{X}_2/\text{H}^+$ $\text{X} = \text{Cl}_2 \text{ or } \text{Br}_2 \text{ or } \text{I}_2$	Enol	alpha halo aldehyde or ketone	$\text{XCH}_2\text{C}=\text{O}(\text{H})(\text{R})$ $\text{X} = \text{halogen}$
Aldehyde or ketone with alpha hydrogens $\text{RCH}_2\text{C}=\text{O}(\text{H})(\text{R})$	$\text{X}_2/\text{OH}^-$ $\text{X} = \text{Cl}_2 \text{ or } \text{Br}_2 \text{ or } \text{I}_2$	Enolate $\text{RCH}^-\text{C}=\text{O}(\text{H})(\text{R})$	alpha di-halo aldehyde or ketone brominates two times	$\text{X}_2\text{CC}=\text{O}(\text{H})(\text{R})$ $\text{X} = \text{halogen}$
Methyl ketone $\text{R-COCH}_3$	$\text{X}_2/\text{OH}^-$ $\text{X} = \text{Cl}_2 \text{ or } \text{Br}_2 \text{ or } \text{I}_2$	Enolate $\text{R-COCH}_2^-$	Acid brominates three times	$\text{RCOOH}$ <u>Haloform Reaction</u>
Acid with alpha Hydrogens $\text{RCH}_2\text{COOH}$	1) $\text{PBr}_3/\text{Br}_2$ 2) $\text{H}^+$	Enol	alpha-halo acid	<u>Hell Volhard Zelinsky reaction</u> $\text{RCHBrCOOH}$
alpha halo aldehyde or ketone $\text{RCH}_2\text{CHXCOR}' \text{ X=Hal}$	Amine/heat Dehydro halogenate	NA	alpha-beta unsaturated aldehyde/ketone	$\text{RCH}=\text{CHCOR}'$
Aldehyde or ketone or ester or nitrile with alpha hydrogens $\text{RCH}_2\text{C}=\text{O}(\text{H})(\text{R})$	1) LDA 2) $\text{R}'\text{X}$ $\text{X} = \text{halogen}$ SN2	Enolate $\text{RCH}^-\text{C}=\text{O}(\text{H})(\text{R})$	alpha-alkylated product	$\text{RR}'\text{CHC}=\text{O}(\text{H})(\text{R})$
Malonic ester $\text{CH}_3\text{CH}_2\text{OCOCH}_2\text{COOCH}_2\text{CH}_3$	1) Base, OR <sup>-</sup> 2) $\text{R}'\text{X}$ , SN2 3) $\text{H}^+$ lose $\text{CO}_2$	Enolate	Acid	$\text{R}'\text{CH}_2\text{COOH}$
Acetoacetic ester $\text{CH}_3\text{COCH}_2\text{COOCH}_2\text{CH}_3$	1) Base, OR <sup>-</sup> 2) $\text{R}'\text{X}$ , SN2 3) $\text{H}^+$ lose $\text{CO}_2$	Enolate	Methyl Ketone	$\text{CH}_3\text{COCH}_2\text{R}'$

Table XII

Reagent code list for carbonyl

condensation reactions

<u>CARBONYL</u>	<u>CONDENSATION</u>	<u>REACTIONS</u>	<u>CODE</u>	<u>LIST</u>
<u>STARTING MATERIAL</u>	<u>REAGENT CODE</u>	<u>NU</u>	<u>PRODUCT</u>	<u>STRUCTURE</u>
Aldehyde or ketone with alpha hydrogens $R-COCH_3$	1) Base, OR self condensation <u>two moles</u>	Enolate $R-COCH_2^-$	beta-hydroxy ketone  $RCOCH_2CCH_3$ <u>may lose <math>H_2O</math></u> <u>to give alkene</u> $RCOC=CCH_3$	<u>Aldol Condensation</u>
<u>MIXED ALDOL POSSIBLE IF</u>	<u>ONE ALDEHYDE OR</u>	<u>KETONE HAS</u>	<u>NO ALPHA</u>	<u>HYDROGENS</u>
<u>IF BOTH IN</u>	<u>SAME MOLECULE A</u>	<u>CYCLIC</u>	<u>beta-hydroxy</u> <u>ketone</u>	<u>RESULTS</u>
Ester with Alpha Hydrogens $CH_3COOCH_3$	1) Base, OR self condensation <u>two moles</u>	Enolate $CH_2^-COOCH_3$	beta-keto ester	<u>Claisen</u> <u>Condensation</u> $CH_3COCH_2COOCH_3$
<u>MIXED CLAISEN POSSIBLE IF</u>	<u>ONE ESTER</u>	<u>HAS</u>	<u>NO ALPHA</u>	<u>HYDROGENS</u>
<u>IF BOTH IN</u>	<u>SAME MOLECULE A</u>	<u>CYCLIC</u>	<u>BETA DIKETONE</u>	<u>RESULTS</u>
$H_2C=CH-C=O(H)(R)$ alpha, beta unsat ketone	beta diketone $RCOCH_2COCH_3$ /OR-	Enolate $RCOCH^-COCH_3$		<u>Michael Reaction</u> $NUCH_2CH_2C=O(H)R$ $NU=RCOCH^-COCH_3$ Conjugate addition
$H_2C=CH-C=O(H)(R)$ alpha, beta unsat ketone	1) Enamine	Enolate		$RCOCH_2CH_2C=O(H)(R)$ Stork Modification of Michael Reaction Conjugate addition

Table XIII

Reagent code list for preparation

and reactions of amines

<u>PREPARATION AND</u>	<u>REACTIONS</u>	<u>OF</u>	<u>AMINES</u>	<u>CODE</u>	<u>LIST</u>
<u>STARTING MATERIAL</u>	<u>REAGENT CODE</u>	<u>MECHANISM</u>	<u>PRODUCT</u>	<u>USES</u>	<u>LIMITATIONS</u>
Nitrile RCN	LAH	H- Reduction	$\text{RCH}_2\text{NH}_2$	1° Amine Prep	None
Amide $\text{RCONH}_2$	LAH	H- Reduction	$\text{RCH}_2\text{NH}_2$	1° Amine Prep	None
Primary Alkyl Halide $\text{RCH}_2\text{Br}$	$\text{NH}_3$	$\text{SN}_2$	Primary Amine $\text{RCH}_2\text{NH}_2$	Bulk preparation of amines	Gives mixtures with sec, tert amines
Primary Amine $\text{RCH}_2\text{NH}_2$	Primary Alkyl Halide $\text{RCH}_2\text{Br}$	$\text{SN}_2$	Sec Amine $(\text{RCH}_2)_2\text{NH}$	Bulk preparation of amine	Gives mixtures with tert amines
Sec Amine $(\text{RCH}_2)_2\text{NH}$	Primary Alkyl Halide $\text{RCH}_2\text{Br}$	$\text{SN}_2$	Tert Amine $(\text{RCH}_2)_3\text{N}$	Bulk preparation of amine	Gives mixtures with quat amines
Tert Amine $(\text{RCH}_2)_3\text{N}$	Primary Alkyl Halide $\text{RCH}_2\text{Br}$	$\text{SN}_2$	"Quat" Amine $(\text{RCH}_2)_4\text{N}^+ \text{Br}^-$	Bulk preparation of Soaps	None
Phthalamide	Primary Alkyl Halide $\text{RCH}_2\text{Br}$	$\text{SN}_2$	Primary Amine $\text{RCH}_2\text{NH}_2$	Prep primary amine no sec or tert byproduct	No sec or tert halide
Primary Alkyl Halide $\text{RCH}_2\text{Br}$	Sodium Azide $\text{NaN}_3$	$\text{SN}_2$	Primary Alkyl Azide $\text{RCH}_2\text{N}_3$	Reactive Synthetic intermediate	Must be Primary Halide
Primary Alkyl Azide $\text{RCH}_2\text{N}_3$	$\text{H}_2/\text{Pd}$ or LAH	Reduction	Primary Amine $\text{RCH}_2\text{NH}_2$	High yields of Primary amine	None
Aldehyde/ketone $\text{RCH}_2\text{CHOH(R)}$	1, $\text{NH}_3$ 2) LAH	Reduction	Prim or sec Amine	High yields of amine	None
Amide $\text{RCONH}_2$	1) $\text{OH}^-$ $\text{Br}_2$	Isocyanate Intermediate	Primary Amine $\text{RNH}_2$	Amine with one less carbon	None Hoffman <u>Degradation</u>
Acid Chloride $\text{RCOCl}$	1) $\text{NaN}_3$ 2) Heat $-\text{CO}_2$	Isocyanate Intermediate	Primary Amine $\text{RNH}_2$	Amine with one less carbon	None Curtius <u>Rearrangement</u>

$\text{ArNH}_2$ Aromatic Amine	$\text{HONO}$ Nitrous acid		$\text{ArN}_2^+$ Diazonium salt	Source of $\text{Ar}^+$	None
$\text{ArN}_2^+$ Diazonium salt	$\text{HX}$ $\text{CuX}$ $\text{X} = \text{hal}$	$\text{X}^-$ on $\text{Ar}^+$	$\text{ArCl}$ or $\text{ArBr}$ or $\text{ArI}$	Prep Halobenzenes	None
$\text{ArN}_2^+$	$\text{CuCN}$	$\text{CN}^-$ on $\text{Ar}^+$	$\text{ArCN}$	Prep Aromatic Nitriles	None
$\text{ArN}_2^+$	$\text{Cu}_2\text{O}/\text{H}_2\text{O}$	$\text{OH}^-$ on $\text{Ar}^+$	$\text{ArOH}$	Prep Phenols	None
$\text{ArN}_2^+$	$\text{H}_3\text{PO}_2$	$\text{H}^-$ on $\text{Ar}^+$	$\text{ArH}$	Replace $\text{NO}_2$ on Ring with H	None
"Quat" Amine $\text{RCH}_2\text{CH}_2\text{N}(\text{CH}_3)_3^+ \text{Br}^-$	1) $\text{Ag}_2\text{O}$ or $\text{OH}^-$ 2) Heat loses $(\text{CH}_3)_3\text{N}$	E2	Alkene $\text{RCH}=\text{CH}_2$	Gives <u>least</u> substituted alkene <u>Hoffman Elimination</u>	None

Table XIV

Reagent code list for  
reactions of carbohydrates

<u>REACTIONS</u>	<u>OF</u>	<u>SUGARS</u>	<u>CODE</u>	<u>LIST</u>	
<u>STARTING MATERIAL</u>	<u>REAGENT CODE</u>	<u>MECHANISM</u>	<u>PRODUCT</u>	<u>USES</u>	<u>COMMENTS</u>
KETO SUGAR D OR L	<u>OH<sup>-</sup></u>	<u>enolization</u>	ALDO SUGAR	SUGAR ISOMERIZATION	KETO SUGAR GIVES <u>POSITIVE TOLLENS</u> TEST DUE TO THIS!
ANY ALDO OR KETO SUGAR	NaBH <sub>4</sub>	Hydride reduction	polyol	SUGAR REDUCTION	
ANY ALDO OR KETO SUGAR	Ag <sup>+</sup> (NH <sub>3</sub> ) <sub>2</sub> OH <sup>-</sup> <u>Tollens reagent</u>	Oxidation	Acid Sugar and Ag metal COOH on Terminal of Sugar	SUGAR OXIDATION	<u>Silver mirror</u> means reducing sugar with a hemiacetal or free aldehyde group <u>TEST FOR GLUCOSE!</u>
ALDO SUGAR	Cu <sup>2+</sup> (NH <sub>3</sub> ) <sub>4</sub> <u>Blue Fehlings</u> <u>Solution</u>	Oxidation	Acid Sugar and Cu <sub>2</sub> O COOH on Terminal of Sugar	SUGAR OXIDATION	<u>Red Cu<sub>2</sub>O</u> means reducing sugar with hemiacetal or free aldehyde group <u>TEST FOR GLUCOSE!</u>
ALDO SUGAR	Br <sub>2</sub>	Oxidation	Acid Sugar COOH on Terminal of Linear Sugar	SUGAR OXIDATION	
ALDO SUGAR	HNO <sub>3</sub>	Oxidation	Acid Sugar COOH on Terminal of Linear Sugar	SUGAR OXIDATION	
ALDO SUGAR	1) HCN 2) H <sub>2</sub> / BaSO <sub>4</sub> 3) H <sub>3</sub> O <sup>+</sup>	Cyanohydrin then hydrolysis	ALDO SUGAR WITH ONE MORE CARBON	SUGAR SYNTHESIS	New sugar mixture of enantiomers at newly created site <u>Kiliani-Fischer</u> <u>Synthesis</u>
ALDO SUGAR	1) NH <sub>2</sub> OH 2) Ac <sub>2</sub> O 3) OH <sup>-</sup>	Oxime then dehydration to cyanohydrin	ALDO SUGAR WITH ONE LESS CARBON	SUGAR SYNTHESIS	<u>Wohl Degradation</u>

Alpha (Axial) cyclic sugar	OH- or H <sub>3</sub> O <sup>+</sup>	Ring opening to free aldehyde	Beta (equatorial) cyclic sugar (predominates)	CYCLIC ISOMERIZATION TO MOST STABLE FORM	<u>MUTAROTATION</u>
-------------------------------	---	-------------------------------------	---	--	---------------------

Alpha or Beta cyclic sugar	ROH/H <sub>3</sub> O <sup>+</sup>	Ether formation at anomeric carbon	<u>Glycoside</u> RO at anomeric carbon	<u>Protects sugar from</u> <u>mutarotation</u> Not reversible to hemiacetal at anomeric carbon	<u>Negative Tollens</u> <u>Test!</u> No aldehyde present
-------------------------------	-----------------------------------	---	--	--	---

Sucrose or other cyclic sugar with no hemiacetal carbon	Ag <sup>+</sup> NH <sub>3</sub> OH- <u>Tollens reagent</u> or Cu <sup>+2</sup> (NH <sub>3</sub> ) <sub>4</sub> <u>Blue Fehlings</u> <u>Solution</u>	NONE!	NR		Nothing to Oxidize
--	---	-------	----	--	-----------------------
